Fiche de Projet de Stage de M2, 2022-2023

Unité INSERM ou CNRS ou Université : Inserm U1016, CNRS UMR 8104, Université Paris Cité	Responsable du Stage : Jérôme Delon
Intitulé Equipe : Signalisation des cellules immunes et infection rétrovirale	Contacts Adresse : Institut Cochin, 22 rue Méchain, 75014 Paris
ED d'appartenance : BioSPC	Email : jerome.delon@inserm.fr
Responsable de l'Equipe : Clotilde Randriamampita	Tel : 01 40 51 66 40

Titre du projet : Impact de mutations génétiques des RHO GTPases identifiées chez des patients sur la physiologie cellulaire

Résumé du Projet de Stage (en 300 mots maximum, mots clés en gras)

Small GTPases of the Rho family, their regulators and their effectors assemble molecular platforms at the surface of membranes that control multiple signaling pathways. These signaling platforms are involved in various physiological functions and processes in the cell, such as the regulation of the cytoskeleton, adhesion, migration or the cell cycle. Mirroring these major functions, their deregulations can be at the origin of human pathologies such as immune deficiencies and inflammatory syndromes. However, how molecular defects in Rho pathways result in clinical symptoms is extremely complex and has remained poorly understood.

In this project, we identified patients with missense mutations affecting the small GTPase CDC42, as well as $G\alpha_{13}$, a subunit of a heterotrimeric G protein that recruits a Rho exchange factor, all of which result in a spectrum of disabling skin diseases, often with inflammatory and immune symptoms. **These rare diseases provide a unique opportunity to unravel the inner workings of Rho GTPases molecular circuits from the molecule to the patient.** With this aim, we will use complementary expertise, including biochemistry, molecular and cell biology, and imaging. We will investigate the mutational landscape of the Rho pathways in a large and unique cohort of patients, identify the biochemical and cellular defects associated with the mutations, and determine the impact of the mutations on Rho GTPase functions. We will particularly focus our studies to understand how the cytoskeleton can impact on the inflammatory microenvironment.

The project should thus impact fundamental and translational research in several ways.
